The article examines structural shifts in the labor resources and demography of the Russian Federation, its economic potential and sources of filling the GDP. It was determined that the Russian Federation has income from the export of oil and gas, which it uses for the development of dual technologies and the production of military products. It was established that the Russian Federation uses its military potential to conduct armed conflicts, seize and annex the territories of other countries, or create unrecognized territorial groups that cannot develop their own economy and actually become colonies of the Russian Federation, which dictates its laws and places its military contingent on their territories. Such a policy allows the Russian Federation to seize not only territories, but also enterprises and even include the population in its composition, thereby, improving its demography.

Armed conflicts are accompanied by human losses, but according to Russian statistics, before the invasion of Ukraine, the losses were not significant, and the inclusion of the population of the annexed territories into the Russian Federation only improved demography.

The article builds a model that allows forming the composition of the population by age groups based on information about the birth of the population and taking into account the features of growing up and natural mortality. Using this model, it is possible to calculate the population size by age groups both for the entire population and separately for men and women.

With the help of this model, the composition of the population by age groups was constructed based on information on annual birth rate starting from 1946 and taking into account the mortality rate at each age. The paper compares data on the composition of the population by age groups as of January 1, 2022 and data obtained with the help of the model. The comparison revealed anomalies in the data on the demographic composition of the population obtained from the censuses conducted in 2002, 2010 and 2020.

The first anomaly is manifested in the fact that the population aged 15 to 50 years, given by official statistics as of 01/01/2022, exceeds the number of births in the corresponding years. Population migration statistics do not confirm such a movement. It was found that this could be a systematic error in the organization of the census processes.

The second anomaly is a significant decrease in the population in the age groups over 50 years, which significantly exceeds the natural mortality of the population. It was determined that this may be the result of population losses during armed conflicts of past periods.

The third anomaly is based on the fact that having additional revenues from the sale of oil and gas, the Russian Federation directs them not to improving the welfare of its own people, but to the production of murder weapons, trades in military equipment and uses it to carry out its own policy of seizing territories, annexing them, or creating unrecognized territorial groups that are unable form their own economy and become actually colonies of the Russian Federation. It was determined that such a strategy is terrorist for the world and genocide for its own people.
